

Node.js for Beginners

Lab Exercise 1

1. Implement a command in `todo.js` that removes an item from the todo list.
2. Write a `package.json` file to require the dependencies 'express', 'mongoose', and 'lodash'
3. Write two files: `a.js` and `b.js`. File `a.js` should require `b.js`, while file `b.js` should have a function accessible to `a.js`
4. Write a node script that creates 'n' text files. These files need not have any content in them. 'n' will be defined in a local variable. For this exercise, you'll need to make use of the Node's 'fs' module.
